

ModernGigabyte Launches ModernBill Version 5.0

The all new, more powerful, extensible ModernBill is released.

Louisville, KY (PRWEB) July 10, 2006 -- ModernGigabyte, LLC., developers of ModernBill, the leading billing automation software company, announce the new release of ModernBill 5.0. Built on the new MBAPI, ModernBill 5.0 is no longer just for the hosting industry as the extensibility of the ModernBill core engine provides a foundation for any organization needing a flexible and automated billing solution.

With the release of ModernBill 5.0, many new features are available including a software developer's kit. Developers can use the SDK, exclusively available to ModernBill customers, to integrate 3rd party applications into the ModernBill 5.0 core engine, also known as the MBAPI. Developers also have the ability to develop their own applications using the MBAPI engine.

"We developed ModernBill Version 5.0 completely from scratch in order to build a solid product that enables companies of all sizes to begin billing their customers using an online, automated billing system and provides a foundation for developers to integrate or build their own applications using the MBAPI," said Jon McCarrick, Vice President of Sales at ModernGigabyte.

Major features of the new ModernBill 5.0 include multiple language, currency, and tax capabilities. Companies are no longer required to run multiple installations of ModernBill in order to sell products and services to multiple countries. ModernBill 5.0 provides the ability to run only one installation in order to cater to multiple countries, languages, currencies, and taxes.

ModernBill 5.0 extends support to larger companies requiring more powerful databases including Microsoft SQL Server and Oracle. Both MySQL and PostgreSQL are also supported.

ModernBill 5.0 uses the Smarty template engine to allow complete customization of the administration, client and order system. Companies can build themes specific to their branding and integrate ModernBill's new widget-style shopping cart system into their existing website. These interfaces also can be remotely located from each other thus further improving branding options and increasing security.

Administrators can take full advantage of ModernBill 5.0 by creating unlimited products, add-ons and custom questions that can be presented to customers during the order process. Each product can be tied to a unique account ledger with the new advanced accounting system. Tracking expenses and revenues down to the product makes it easier for accountants to monitor company growth.

This new release solidifies ModernGigabyte's place as the premier billing solution for the hosting industry and opens its usefulness to many new industries including ISPs, software

vendors, and general ecommerce. ModernGigabyte has launched a new website at <http://www.modernbill.com> to coincide with this major version release to reflect the new features and functionality now available.

About ModernGigabyte, LLC:

ModernGigabyte, LLC. develops the most advanced automated and recurring billing software on the market today. ModernBill billing software, combined with their complete product and services suite, delivers a powerful, easy-to-use, integrated business solution. ModernBill is completely web based and provides both administrator and client access to manage products, invoices, and payment options. It can create and process invoices, batch charges with a variety of popular merchant gateways, and report many important accounting functions. It includes integrated shopping cart widgets and order forms and is completely customizable to fit any company's branding.
